

Question 1			
		Answer	Marks
(a)		<p>Ambrox (<math>C_{16}H_{28}O</math>) has a molar mass of <math>((16 \times 12.01) + (28 \times 1.008) + (1 \times 16)) = 236.384 \text{ g mol}^{-1}</math>.</p> <p>10000000 g produced every year, therefore <math>(10000000/236.384) = 4.2 \times 10^4</math> moles of Ambrox are produced each year.</p>	1 mark
(b)		<div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <p><b>A</b></p>  <p><math>C_{16}H_{28}O_3S</math></p> </div> <div style="text-align: center;"> <p><b>B</b></p>  <p><math>C_{16}H_{25}N</math></p> <p>Accept structures with the nitrile group shown as CN</p> </div> </div>	1 mark per correct structure
		<div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <p><b>C</b></p>  <p><math>C_{16}H_{26}O_2</math></p> <p>Accept structures with the carboxyl group shown as COOH.</p> </div> <div style="text-align: center;"> <p><b>D</b></p>  <p><math>C_{16}H_{30}O_2</math></p> </div> </div>	
(c)	i)	The percentage yields for each step are combined to give an overall yield of 24.87 %.	1 mark
	ii)	<p>Number of moles of (-)-drimenol needed = (number of moles of Ambrox produced in a year)/(overall yield) = <math>(42304.5/0.2487) = 170102.5</math> moles of (-)-drimenol</p> <p>(-)-drimenol has a molar mass of <math>((15 \times 12.01) + (26 \times 1.008) + (1 \times 16)) = 222.358 \text{ g mol}^{-1}</math>.</p> <p>The mass of (-)-drimenol needed is therefore <math>(222.358 \times 170102.5) = 38 \text{ tonnes}</math>.</p> <p>Also accept correctly worked solutions using the candidate's answers to (a) and (c) i).</p> <p>Do not penalise candidates for rounding values in the intermediate part of the calculation.</p>	1 mark
	iii)	The mass of bark needed = (mass of (-)-drimenol)/(proportion of (-)-	1 mark
		<p>drimenol in bark) = <math>37.825/0.005 = 7.6 \times 10^3 \text{ tonnes}</math>.</p> <p>Also accept correctly worked solutions using the candidate's answer to (c) ii).</p>
